

Rolling window → call graph

Toy session with N=6 events and stride=3 (production is N=16, stride=8). Source: shortened shop enumeration / BOLA-style GET burst.

9 events

One session timeline

N = 6

Events per window

S = 3

Slide by 3 events

Two separate ideas

The window is a slice of the event list. The graph is that slice after collapsing concrete paths (orders/8, orders/26) into one OpenAPI node (GET orders/{id}).

Session event stream (raw HTTP)				
#	Method	Raw path	Graph node after collapse	Δt from previous
e1	POST	/identity/api/auth/login	POST login	—
e2	GET	/workshop/api/shop/products	GET products	1.1s
e3	GET	/workshop/api/shop/orders/8	GET orders/{id}	0.2s
e4	GET	/workshop/api/shop/orders/26	GET orders/{id}	0.1s
e5	GET	/workshop/api/shop/orders/20	GET orders/{id}	0.1s
e6	GET	/workshop/api/shop/orders/45	GET orders/{id}	0.2s

Agent reports stay in the chat. Drop the file → free short link.

Buy me a coffee

Drop yours → free short link

e8	GET	/workshop/api/shop/orders/28	GET orders/{id}	0.2s
e9	GET	/workshop/api/shop/orders/all	GET orders/all	0.8s

Highlighted rows are window 1 (e1–e6). orders/8 and orders/26 are different objects but the same graph node.

How the window slides

Window 1 - events e1–e6

train later: y=1

e1

e2

e3

e4

e5

e6

e7

e8

e9

Cover (login, products) plus first four foreign order GETs.

Window 2 - events e4–e9

stride 3

e1

e2

e3

e4

e5

e6

e7

e8

e9

Same session, later slice. Overlap e4–e6 so the burst is not cut only at a boundary.

Window 1 as a graph (not a list)

Consecutive events become directed edges. Repeating GET orders/{id}becomes a self-loop. Edge labels are (count, mean Δt).

Contrast: a BFLA window

Same machinery. Different nodes. No heavy self-loop on orders/{id}.

Events in one short session

#	Collapsed node
e1	POST login
e2	GET orders/all
e3	GET management/users/all
e4	GET mechanic/
e5	GET mechanic_report

Graph shape

Chain: login → orders/all → users/all → mechanic/ → mechanic_report.

Unique-node count is high for a 5-event window. Privileged templates appear. Session shorter than N uses the whole session as one graph (no dummy nodes).

Scoring

Each window gets an attack probability. The session score is the max over those windows. A login-only prefix can look normal; the later burst window is what flags the session.

How to share an agent report

Cursor writes `.canvas.tsx` next to the chat. Claude and ChatGPT export HTML. Agents dump Markdown with mermaid. Slack and email just send a path nobody else can open. This page is a free viewer: drop the file, render it, copy a short link. Try the [public demo gallery](#) first.

Built for

- Architecture reviews
- Product & GTM specs
- Claude / ChatGPT artifacts
- Mermaid diagrams in Slack
- Metrics / billing dumps
- Security audits
- Incident writeups
- JSON payloads teammates cannot open

How it works

Drop or paste `.canvas.tsx`, `.md`, `.html`, or `.json` — or run `npx --yes github:brian-mwirigi/canvas-share file.md`

Preview the live render in your browser

Copy a short link like `/canvas/a8k2m9qx`

Send it — or embed it with `?embed=1`

FAQ

How do I share a Cursor canvas?

Cursor canvases are local `.canvas.tsx` files. Drop the file at [brianmunene.me/canvas](#) (or run `npx --yes github:brian-mwirigi/canvas-share file.canvas.tsx`) to get a short URL teammates can open in any browser.

Can teammates open a .canvas.tsx file?

Not in Cursor unless they have the file. This viewer renders the canvas in the browser and gives you a short link like `/canvas/a8k2m9qx`.

Does it only work with Cursor?

No. Cursor canvases are one format. It also renders Markdown (GFM + mermaid), Claude/ChatGPT HTML artifacts, SVG, and JSON.

How do I share a Claude or ChatGPT HTML artifact?

Download or copy the HTML, drop it at `/canvas`, copy the short link. HTML runs in a sandboxed iframe so it cannot touch the parent page.

Does mermaid work?

Yes. Fenced ````mermaid` blocks in Markdown render as diagrams.

How do short links work?

You get a short URL like `/canvas/a8k2m9qx`. Send it to your team. They open it in any browser. Email support@brianmunene.me if you want a link taken down.

Can I embed a share in a doc?

Yes. After you have a short link, use Copy embed for an iframe pointing at `/canvas/{id}?embed=1`.

Is there a CLI?

Yes. `npx --yes github:brian-mwirigi/canvas-share path/to/file` prints a short `https://brianmunene.me/canvas/...` link. Works for `.canvas.tsx`, `.md`, `.html`, and `.json`.

Is it free?

Yes. No account. Open the public demos at `/canvas/demo` before uploading your own file.

Who can open a short link?

The people you send it to. Shares are not listed on the site. Email support@brianmunene.me with the share id if you want one taken down. Privacy: `/privacy`.
